The Mages Malison: Web Exploit - Beginner

Creator: Sufiyan Shariff Points: –

Description

This is a command injection challenge where the users have to use unix commands to exploit the file system to reveal the flag. The webpage has an input field, and a display area showing the results of running the commands.
PS: if running command on windows, path may appear as folder_p\\folder_c, instead of folder_p/folder_c

Github Path: /Web_Exploit/The_Mages_Malison

Prompt

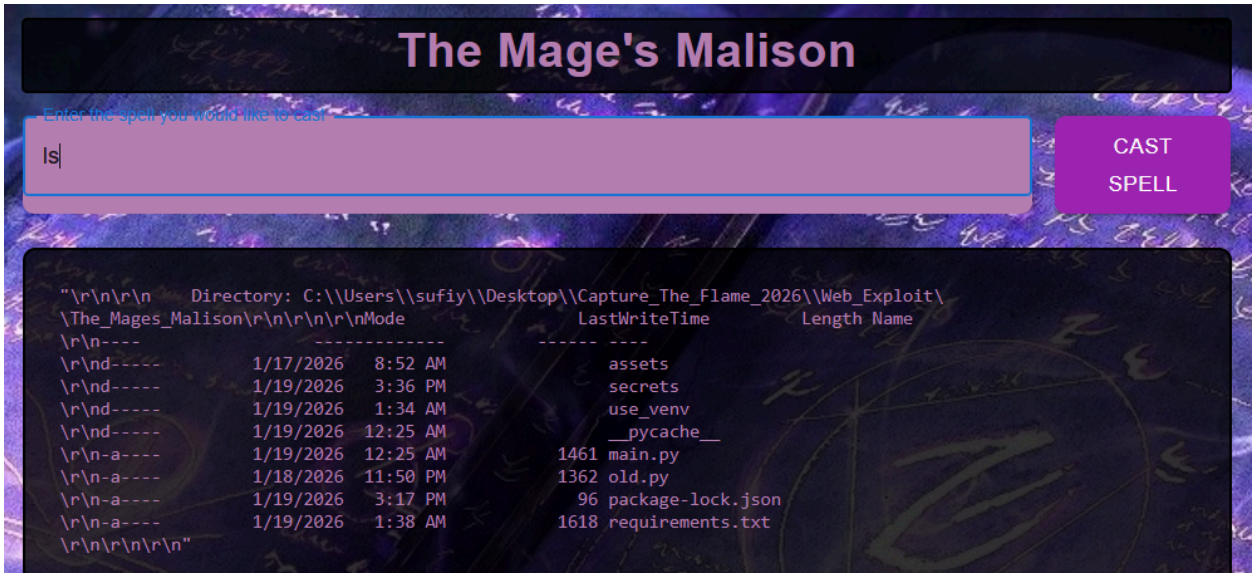
The year is 1318. You are a mage who was cursed with weak memory half a decade ago and you have spent the last few years in search of who cursed you. You have found the witch who cursed you and she promises to lift the curse if you can use spells (unix commands) to read her mind and reveal the greatest secret she has kept (the flag).

Hints

1. The effects of spells are not cumulative unless they are cast together (i.e: multiple commands separated by semicolons are provided)
2. There are many secrets to comb through, read the prompt again to find which has to do with you.

Solution

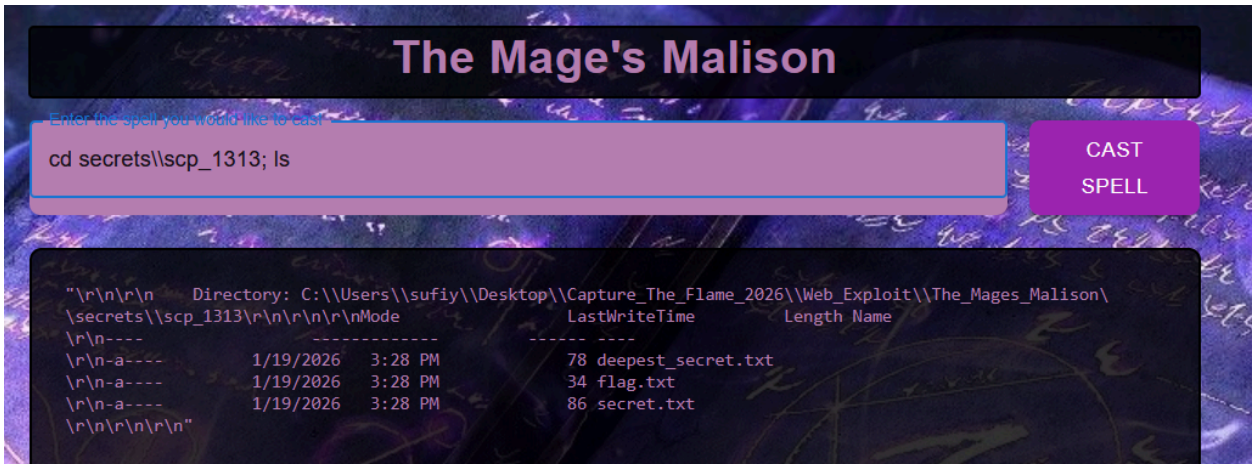
1. Cast spell(command) **ls** to see what files are available to you



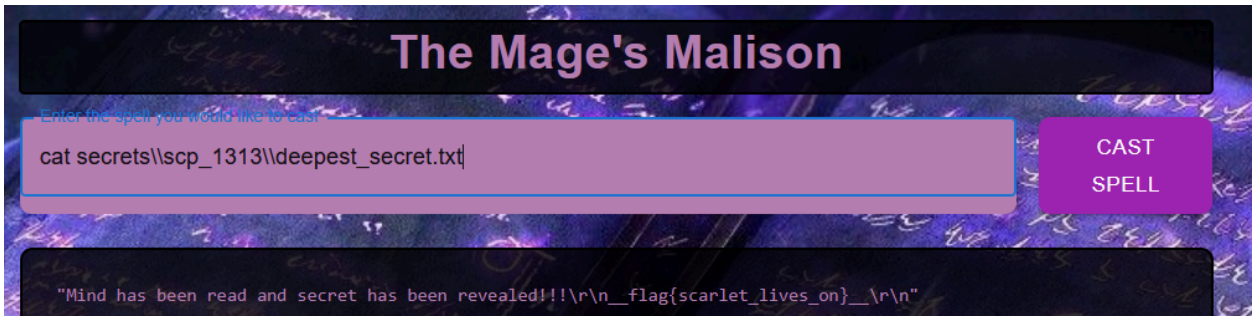
2. Navigate to inside the **secrets** folder using **cd secrets** and examine the contents using **ls**. Pass the commands as one line separated by semicolons: **cd secrets; ls**

3. Examine the contents of **the_accursed.txt** to see who has been cursed

4. The prompt says the current year is 1318, and the mage was cursed half a decade ago (5 years) so 1318 - 5 = 1313. We need to look at the folder associated with **SCP_1313**. Navigate to the folder **scp_1313** and examine the contents inside.



5. Examine the text files till you get the flag, only one file has the flag in the right format.



6. Submit the flag in the flag{content} format

Flag

```
flag{scarlet_lives_on}
```
